Evaluation Strategy

Comparing Output generated by Multiple LLMS

here I am comparing with ChatGPT model answer with my Project Groq LLM

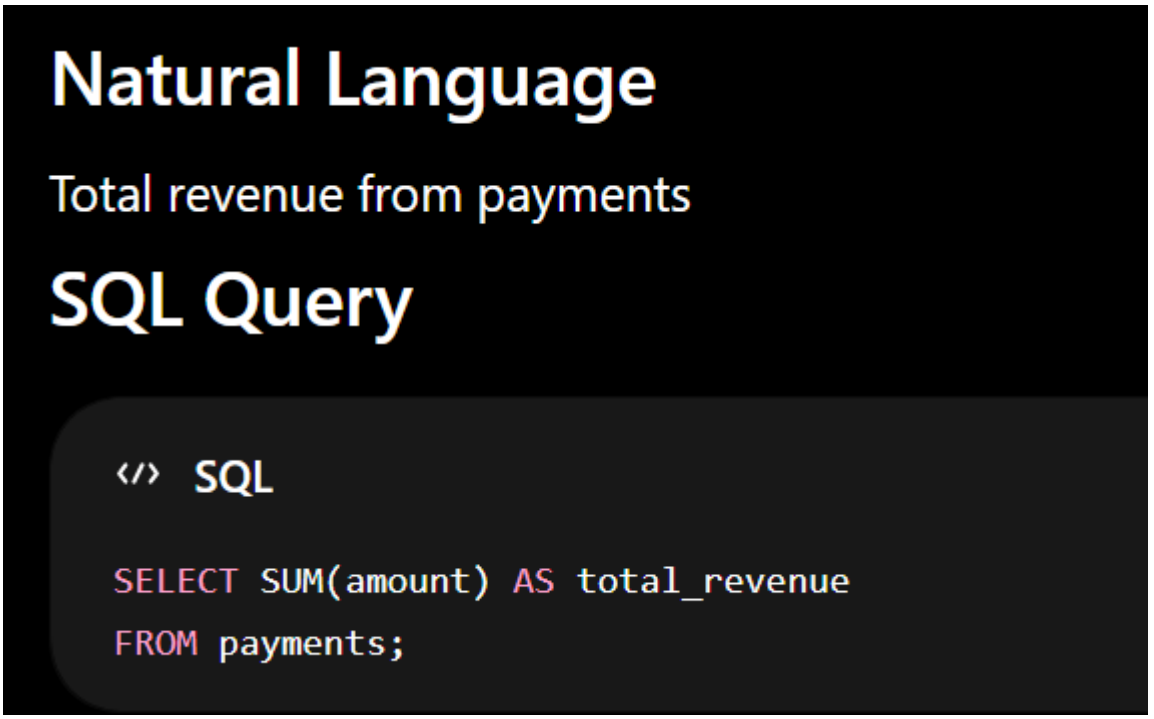

ChatGPT Output

Project LLM Output

```
User Query : List employee first and last names
Output : SELECT firstName, lastName FROM employees
```

GPT Output

Project LLM Output

```
User Query : Total revenue from payments
Output : SELECT SUM(amount) FROM payments
```

Terminal Output

```
INFO - Decomposition successful:

Query Decomposition:
  Intent: Get payments with customer country
  Tables: payments, customers
  Columns: paymentID, customerNumber, customerCountry
  Filters: None
  Joins: ['INNER JOIN customers ON payments.customerNumber = customers.customerNumber']
  Aggregations: None

INFO -
============================================================
INFO - ATTEMPT 1/3
INFO - ============================================================
INFO - STEP 2: Generating SQL query...
INFO - Generated SQL: SELECT p."customerNumber", c.country, p.amount
FROM payments p
JOIN customers c ON p."customerNumber" = c."customerNumber";
INFO - STEP 3: Validating SQL query...
INFO - Query validation passed
INFO - STEP 4: Executing SQL query...
INFO - Query executed successfully in 949.59ms
INFO - Result rows: 1
INFO - STEP 5: Summarizing results...
INFO - Summary: There are 496 payments from various countries, with the majority coming from the USA (134 payments) and France (34 payments).
